|                                                                                                             |           |
|-------------------------------------------------------------------------------------------------------------|-----------|
| List of figures                                                                                             | xiii      |
| List of tables                                                                                              | xvii      |
| List of listings                                                                                            | xix       |
| Preface                                                                                                     | xxiii     |
| <b>CHAPTER 1 ■ Understanding the need for parallel computing</b>                                            | <b>1</b>  |
| 1.1 INTRODUCTION                                                                                            | 1         |
| 1.2 FROM PROBLEM TO PARALLEL SOLUTION –<br>DEVELOPMENT STEPS                                                | 2         |
| 1.3 APPROACHES TO PARALLELIZATION                                                                           | 4         |
| 1.4 SELECTED USE CASES WITH POPULAR APIS                                                                    | 6         |
| 1.5 OUTLINE OF THE BOOK                                                                                     | 7         |
| <b>CHAPTER 2 ■ Overview of selected parallel and distributed<br/>systems for high performance computing</b> | <b>11</b> |
| 2.1 GENERIC TAXONOMY OF PARALLEL COMPUTING<br>SYSTEMS                                                       | 11        |
| 2.2 MULTICORE CPUS                                                                                          | 12        |
| 2.3 GPUS                                                                                                    | 14        |
| 2.4 MANYCORE CPUS/COPROCESSORS                                                                              | 17        |
| 2.5 CLUSTER SYSTEMS                                                                                         | 19        |
| 2.6 GROWTH OF HIGH PERFORMANCE COMPUTING<br>SYSTEMS AND RELEVANT METRICS                                    | 20        |
| 2.7 VOLUNTEER-BASED SYSTEMS                                                                                 | 22        |
| 2.8 GRID SYSTEMS                                                                                            | 25        |

|                                                                |           |
|----------------------------------------------------------------|-----------|
| <b>CHAPTER 3 ■ Typical paradigms for parallel applications</b> | <b>29</b> |
| 3.1 ASPECTS OF PARALLELIZATION                                 | 30        |
| 3.1.1 Data partitioning and granularity                        | 30        |
| 3.1.2 Communication                                            | 32        |
| 3.1.3 Data allocation                                          | 32        |
| 3.1.4 Load balancing                                           | 33        |
| 3.1.5 HPC related metrics                                      | 34        |
| 3.2 MASTER-SLAVE                                               | 35        |
| 3.3 GEOMETRIC SPMD                                             | 39        |
| 3.4 PIPELINING                                                 | 55        |
| 3.5 DIVIDE-AND-CONQUER                                         | 56        |
| <b>CHAPTER 4 ■ Selected APIs for parallel programming</b>      | <b>69</b> |
| 4.1 MESSAGE PASSING INTERFACE (MPI)                            | 74        |
| 4.1.1 Programming model and application structure              | 74        |
| 4.1.2 The world of MPI processes and threads                   | 75        |
| 4.1.3 Initializing and finalizing usage of MPI                 | 75        |
| 4.1.4 Communication modes                                      | 76        |
| 4.1.5 Basic point-to-point communication routines              | 76        |
| 4.1.6 Basic MPI collective communication routines              | 78        |
| 4.1.7 Packing buffers and creating custom data types           | 83        |
| 4.1.8 Receiving a message with wildcards                       | 85        |
| 4.1.9 Receiving a message with unknown data size               | 86        |
| 4.1.10 Various send modes                                      | 87        |
| 4.1.11 Non-blocking communication                              | 88        |
| 4.1.12 One-sided MPI API                                       | 90        |
| 4.1.13 A sample MPI application                                | 95        |
| 4.1.14 Multithreading in MPI                                   | 97        |
| 4.1.15 Dynamic creation of processes in MPI                    | 99        |
| 4.1.16 Parallel MPI I/O                                        | 101       |
| 4.2 OPENMP                                                     | 102       |
| 4.2.1 Programming model and application structure              | 102       |
| 4.2.2 Commonly used directives and functions                   | 104       |
| 4.2.3 The number of threads in a parallel region               | 109       |

|       |                                                                                 |            |
|-------|---------------------------------------------------------------------------------|------------|
| 4.2.4 | Synchronization of threads within a parallel region and single thread execution | 109        |
| 4.2.5 | Important environment variables                                                 | 111        |
| 4.2.6 | A sample OpenMP application                                                     | 112        |
| 4.2.7 | Selected SIMD directives                                                        | 115        |
| 4.2.8 | Device offload instructions                                                     | 115        |
| 4.2.9 | Tasking in OpenMP                                                               | 117        |
| 4.3   | <b>PTHREADS</b>                                                                 | <b>118</b> |
| 4.3.1 | Programming model and application structure                                     | 118        |
| 4.3.2 | Mutual exclusion                                                                | 121        |
| 4.3.3 | Using condition variables                                                       | 123        |
| 4.3.4 | Barrier                                                                         | 124        |
| 4.3.5 | Synchronization                                                                 | 125        |
| 4.3.6 | A sample Pthreads application                                                   | 125        |
| 4.4   | <b>CUDA</b>                                                                     | <b>127</b> |
| 4.4.1 | Programming model and application structure                                     | 127        |
| 4.4.2 | Scheduling and synchronization                                                  | 131        |
| 4.4.3 | Constraints                                                                     | 134        |
| 4.4.4 | A sample CUDA application                                                       | 134        |
| 4.4.5 | Streams and asynchronous operations                                             | 137        |
| 4.4.6 | Dynamic parallelism                                                             | 141        |
| 4.4.7 | Unified Memory in CUDA                                                          | 143        |
| 4.4.8 | Management of GPU devices                                                       | 145        |
| 4.5   | <b>OPENCL</b>                                                                   | <b>147</b> |
| 4.5.1 | Programming model and application structure                                     | 147        |
| 4.5.2 | Coordinates and indexing                                                        | 155        |
| 4.5.3 | Queuing data reads/writes and kernel execution                                  | 156        |
| 4.5.4 | Synchronization functions                                                       | 157        |
| 4.5.5 | A sample OpenCL application                                                     | 158        |
| 4.6   | <b>OPENACC</b>                                                                  | <b>167</b> |
| 4.6.1 | Programming model and application structure                                     | 167        |
| 4.6.2 | Common directives                                                               | 168        |
| 4.6.3 | Data management                                                                 | 169        |
| 4.6.4 | A sample OpenACC application                                                    | 171        |
| 4.6.5 | Asynchronous processing and synchronization                                     | 171        |
| 4.6.6 | Device management                                                               | 172        |

|       |                            |     |
|-------|----------------------------|-----|
| 4.7   | SELECTED HYBRID APPROACHES | 172 |
| 4.7.1 | MPI+Pthreads               | 173 |
| 4.7.2 | MPI+OpenMP                 | 177 |
| 4.7.3 | MPI+CUDA                   | 180 |

**CHAPTER 5 ■ Programming parallel paradigms using selected APIs** 185

---

|         |                                       |     |
|---------|---------------------------------------|-----|
| 5.1     | MASTER-SLAVE                          | 185 |
| 5.1.1   | MPI                                   | 186 |
| 5.1.2   | OpenMP                                | 190 |
| 5.1.3   | MPI+OpenMP                            | 197 |
| 5.1.4   | MPI+Pthreads                          | 199 |
| 5.1.5   | CUDA                                  | 207 |
| 5.1.6   | OpenMP+CUDA                           | 213 |
| 5.2     | GEOMETRIC SPMD                        | 218 |
| 5.2.1   | MPI                                   | 218 |
| 5.2.2   | MPI+OpenMP                            | 220 |
| 5.2.3   | OpenMP                                | 225 |
| 5.2.4   | MPI+CUDA                              | 225 |
| 5.3     | DIVIDE-AND-CONQUER                    | 229 |
| 5.3.1   | OpenMP                                | 229 |
| 5.3.2   | CUDA                                  | 232 |
| 5.3.3   | MPI                                   | 235 |
| 5.3.3.1 | Balanced version                      | 236 |
| 5.3.3.2 | Version with dynamic process creation | 240 |

**CHAPTER 6 ■ Optimization techniques and best practices for parallel codes** 251

---

|       |                                                                                                    |     |
|-------|----------------------------------------------------------------------------------------------------|-----|
| 6.1   | DATA PREFETCHING, COMMUNICATION AND COMPUTATIONS OVERLAPPING AND INCREASING COMPUTATION EFFICIENCY | 252 |
| 6.1.1 | MPI                                                                                                | 253 |
| 6.1.2 | CUDA                                                                                               | 256 |
| 6.2   | DATA GRANULARITY                                                                                   | 257 |
| 6.3   | MINIMIZATION OF OVERHEADS                                                                          | 258 |

|                                                    |            |
|----------------------------------------------------|------------|
| 6.3.1 Initialization and synchronization overheads | 258        |
| 6.3.2 Load balancing vs cost of synchronization    | 260        |
| 6.4 PROCESS/THREAD AFFINITY                        | 260        |
| 6.5 DATA TYPES AND ACCURACY                        | 261        |
| 6.6 DATA ORGANIZATION AND ARRANGEMENT              | 261        |
| 6.7 CHECKPOINTING                                  | 262        |
| 6.8 SIMULATION OF PARALLEL APPLICATION EXECUTION   | 264        |
| 6.9 BEST PRACTICES AND TYPICAL OPTIMIZATIONS       | 265        |
| 6.9.1 GPUs/CUDA                                    | 265        |
| 6.9.2 Intel Xeon Phi                               | 266        |
| 6.9.3 Clusters                                     | 269        |
| 6.9.4 Hybrid systems                               | 270        |
| <b>APPENDIX A ■ Resources</b>                      | <b>273</b> |
| <hr/>                                              |            |
| A.1 SOFTWARE PACKAGES                              | 273        |
| <b>APPENDIX B ■ Further reading</b>                | <b>275</b> |
| <hr/>                                              |            |
| B.1 CONTEXT OF THIS BOOK                           | 275        |
| B.2 OTHER RESOURCES ON PARALLEL PROGRAMMING        | 275        |
| <b>Index</b>                                       | <b>297</b> |
| <hr/>                                              |            |
